

Incident Report – Network Outage

Incident Summary

A network outage occurred at the office due to failure of the dedicated internet line provided by Vianet. The outage affected business operations and internet-dependent services during the incident period.

Incident Details

Incident Type: Internet Connectivity Outage

ISP: Vianet

Affected Service: Dedicated Internet Line

Date: 28/05/2026

Start Time: 7:00 AM

End Time: 10:00 AM

Total Downtime: Approximately 3 Hours

Impact

The outage impacted normal business operations, including:

- Inaccessibility of internet-based applications and services
- Disruption in communication and online transactions
- Delayed operational activities dependent on internet connectivity
- Reduced employee productivity during the outage period

Root Cause

As communicated by the ISP (Vianet), the outage was caused by failure/down status of their main router infrastructure, which resulted in disruption of the dedicated internet connection provided to the office.

Resolution

The ISP restored the service after resolving the issue with their main router infrastructure. Internet connectivity was fully restored at approximately 10:00 AM.

Preventive / Corrective Action

To minimize future business impact from ISP outages, it is recommended to implement a secondary internet connection from a different ISP to act as a failover connection.

Recommended Improvements

- Procure an additional dedicated/business internet connection from an alternate ISP like Worldlink or Mercantile.
- Configure automatic WAN failover on the office firewall/router
- Periodically test failover functionality to ensure service continuity
- Monitor ISP uptime and incident trends

Conclusion

The incident highlighted a single point of failure in the current network connectivity setup. Implementing internet redundancy through a secondary ISP connection will significantly improve business continuity and reduce operational risk during future ISP outages.
