

Incident Report - B2B Operations

Date of Report: 22 May 2026

Department: B2B Operations

Incident Summary

Incorrect Processing Amount for Transaction ID IPAY1779409478670906

Overview: This report outlines an operational incident involving transaction ID IPAY1779409478670906 related to sender CALZADO PLAY BEACH. The issue occurred due to 2 KYC documents being available in the sender's folder, which resulted in the transaction being processed for a higher amount than intended.

Incident Details

Transaction ID: IPAY1779409478670906

Sender: CALZADO PLAY BEACH

Issue Description

During transaction creation, the operations team reviewed one of the available KYC documents in the sender's folder, which reflected an amount of USD 50,000. Since the invoice amount was approximately USD 67,000, the USD 50,000 transaction appeared acceptable for processing and was therefore processed accordingly. However, after the transaction had already been processed in FLASH, the Compliance team identified that there was another KYC document available in the same folder. The second KYC document reflected an amount of USD 43,097.00.

Following this finding, the transaction statement was rechecked, and it was confirmed that the actual received MXN amount corresponded to the USD equivalent of USD 43,097.00. This clarified that the intended transaction amount was USD 43,097.00 and not USD 50,000.

Impact

- Excess amount of USD 6,903 was processed.
- Operational discrepancy caused due to 2 KYC documents and incorrect verification during transaction creation.

Current Status / Actions Taken

The matter has been discussed with Marco regarding recovery/settlement of the excess processed amount in the next transaction as the sender may continue sending transactions to the same beneficiary, and the excess amount may potentially be adjusted or settled against upcoming transactions.

Follow-up discussions are ongoing for proper resolution and settlement confirmation.

Conclusion

Additional verification measures and clearer document validation procedures are recommended to prevent similar incidents in future transaction processing
